Greenfoot Project: Description of Game

I am creating a game called Squeak & Seek. The player controls a mouse through a maze to reach a piece of bread while avoiding snakes. The mouse is controlled with arrow keys and there is a timer to create urgency. The player must reach the bread before the timer runs out and avoid running into snakes, or they will lose the game. Messages will be displayed when the player loses, wins, or when the time is up.. So the goal is simple: reach the bread quickly while avoiding snakes.

The Mouse is the main actor controlled by the player using the arrow keys on a keyboard. The mouse is not allowed to go through the maze walls or past the edge of the world. When the mouse reaches either the edge of the world or runs into the maze wall a bump sound will be played. It has to avoid the snakes in the maze or the player loses the game. If the mouse reaches the piece of bread before the timer runs out, the player wins the game.

There are 2 SnakeHorizontal actors and 1 SnakeVertical actor in the maze as the enemies. They patrol a back and forth path in three different positions of the maze. The 2 SnakeHorizontal will patrol going horizontally in the maze, while SnakeVertical will patrol a path vertically in the maze. When the snakes reach the wall or the edge of the world, they will reverse directions and patrol the other way. If the mouse touches any of the snakes, the player will lose the game. The mouse and the snake the mouse ran into will disappear, a specific sound will be played when the player loses, and a message stating "You Lose!" will be displayed.

The Bread actor is a stationary object and is the prize to win the game. The mouse must reach the bread before the timer runs out to win the game. The bread will disappear when the mouse reaches it, a specific sound will be played, and a message stating "You Won!" will be shown.

The MazeWall actor is a stationary object. It creates the path for the maze. The Mouse and snakes may not go through the wall. If the mouse runs into the MazeWall, a bump sound will be played and the player must move the Mouse in a different direction.

The timer actor will start at 45 seconds for the player. It will begin each time the player clicks the run button. The player must move the mouse to the bread before the timer reaches 0. If the player does not reach the Bread before the timer runs out, a specific sound will be played, and a message stating "Time's Up!" will be displayed. This will create urgency and a challenge to the game.
